ACADEMIC YEAR (2019-2020)
VALUE ADDED COURSE ON "Introduction to IOT"
DATE : (14.09.19 TO 25.09.19)

As part of the activity of internet of things/project lab, the department of electronics and communication engineering organized a value added course by Mr.Nagendran of the Be positive institute for skilling india pvt ltd, Tiruchirappalli on 14th sep 2019 at seminar hall smart class.

The Internet of Things (IoT) is a system of interrelated computing devices, mechanical and digital machines, objects, animals or people that are provided with unique identifiers and the ability to transfer data over a network without requiring human-to-human or human-to-computer interaction."

An internet connection is a wonderful thing, it give us all sorts of benefits that just weren't possible before. If you're old enough, think of your cell phone before it was a smartphone. You could call and you could text, sure, but now you can read any book, watch any movie, or listen to any song all in the palm of your hand. The point is that connecting things to the internet yields many amazing benefits. We've all seen these benefits with our smart phones, laptops, and tablets, but this is true for everything else too. And yes, we do mean everything.

In short, the Internet of Things refers to the rapidly growing network of connected objects that are able to collect and exchange data in real time using embedded sensors. Thermostats, cars, lights, refrigerators, and more appliances can all be connected to the IoT. The applications of IoT technologies are multiple, because it is adjustable to almost any technology that is capable of providing relevant information about its own operation, about the performance of an activity and even about the environmental conditions that we need to monitor and control at a distance. The smart home is likely the most popular IoT application at the moment because it is the one that is most affordable and readily available to consumers. The IoT has the potential to transform entire cities by solving real problems citizens face each day. With the proper connections and data, the Internet of Things can solve traffic congestion issues and reduce noise, crime, and pollution.

Creo 2.0, Basic Modeling Tutorial

1. Open Creo Parametric 2.0

2. Hit Select Working Directory on the top bar and select whatever folder you want your new part to go into.

3. Next hit the New Button, make sure the type is set to part. Change the name to whatever you want to name your part and hit OK.

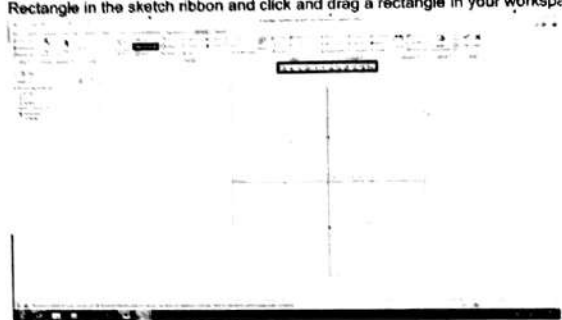

4. Your screen should now look like this. Hit the View tab along the top ribbon and hit the plane tag display button so you can see the names of the planes.

5. Next, select the Top plane, return to the model tab, and hit the extrude button.

6. Then you should be in sketch mode. Hit the sketch view button on the small ribbon in the work area. So that you are viewing the top plane in 2D. Then select Rectangle in the sketch ribbon and click and drag a rectangle in your workspace.

7. Once you click again and then click the select button you will see that inside the rectangle turns orange, and dimensions appear. Change the dimensions so that it has a length and width of 6.00 and the dimensions to the centerlines are 3.00. This is where you start to have freedom. If you want to make something smaller you can, but this is the maximum size you can have for your part. Once you are satisfied hit the check mark to finish the sketch.

8. Next, enter .25 as the thickness for the extrude. This is the thickness of the HDPE you will be cutting. Then hit the check mark.

9. Now, if you want to import an image to sketch over so you can cut it into your HDPE you go to the View tab, click the drop down menu of Model Display, and select Images.

10. Then you hit the Add button and select the top plane of your part. This will bring up browser that you can look through and find your picture in your computer.

11. Then place your picture where you want it and hit the check mark for OK.

12. Now return to the model tab and select the top plane of your part again and hit the Extrude button again. Put another Rectangle over your image. I would leave about .25 inches from the edge of your board.

13. Now you need to use a combination of lines and arcs to sketch out the image you want to have on your board. Then hit the check mark to show that you are finished.

14. Now to make this cut into the board instead of come out of it you need to set the depth to .125 and then hit the arrows next to the depth box to reverse the direction and the remove material button next to the reverse direction button to make it a cut.

15. Then go to the Image menu again and hit the remove button to take away the image you were sketching over.

16. Now hit the save button and you can move on to the Introductory Creo CAM Tutorial to make the .NC files to manufacture your model.

Value added Course on “Auto CAD” (27-06-2019 to 03-07-2019) – 6 Days

The above value added course was generally about the of “Auto CAD” machine design in industrial and also the working environment aspects. And by the way the software working process is all discussed based upon the working area. The Auto CAD design software are utilized in various applications and what is the purpose for the usage of this software, these are all focused by the lecturer. The main concept of Auto CAD design software is Toolbars. The available toolbars in the software was explained through computer. The automobile industries are used this software for machine designing, material productions. Using this software we can design 2D, 3D Module of Machine parts.

Department of Mechatronics had organized a Value added Course on “Auto CAD” by inviting **Venkat Ramana. T** to equip our students with these kinds of additional skill sets from 27.06.2019 to 03.7.2019(6days).Students felt that the value added course was so interesting and useful.

Department of Mechatronics Engineering

Value added Course on “Artificial Intelligence And Medical Equipment” (15-7-2019 to 20-7-2019) – 6 Days

The above value added course was generally about the “**Artificial Intelligence and Medical Equipment**” Artificial intelligence (AI) in healthcare is the use of complex algorithms and software to emulate human cognition in the analysis of complicated medical data. Specifically, AI is the ability for computer algorithms to approximate conclusions without direct human input.

This above value added course is utilise the artificial for medical equipment. Students are well known about What distinguishes AI technology from traditional technologies in health care is the ability to gain information, process it and give a well-defined output to the end-user. AI does this through machine learning algorithms. These algorithms can recognize patterns in behavior and create its own logic. This course detailed about the ability to interpret imaging results with radiology may aid clinicians in detecting a minute change in an image that a clinician might accidentally miss. A study at Stanford created an algorithm that could detect pneumonia at that specific site, in those patients involved, with a better average F1 metric (a statistical metric based on accuracy and recall), than the radiologists involved in that trial

Department of Mechatronics had organized a Value added Course on “Artificial Intelligence and Medical Equipment” by inviting S. ANANDHAKUMAR to equip our students with these kinds of additional skill sets from 15.7.2019 to 20.7.2019(6days). Students felt that the value added course was so interesting and useful.

Department of Mechatronics Engineering

Value added Course on “SOLID WORKS” (5-8-2019 to 10-8-2019) – 6 Days

The above value added course was generally about the of “Solid Works” machine design in industrial and also the working environment aspects. And by the way the software working process is all discussed based upon the working area. The Solid Works design software are utilized in various applications and what is the purpose for the usage of this software, these are all focused by the lecturer. The main concept of Solid Works is a solid modeler, and utilizes a parametric feature-based approach which was initially developed by PTC (Creo/Pro-Engineer) to create models and assemblies. Building a model in Solid Works usually starts with a 2D sketch (although 3D sketches are available for power users). The sketch consists of geometry such as points, lines, arcs, conics (except the hyperbola), and splines are briefly explained with practice to the students. Dimensions are added to the sketch to define the size and location of the geometry. Relations are used to define attributes such as tangency, parallelism, perpendicularity and concentricity. The parametric nature of Solid Works means that the dimensions and relations drive the geometry, not the other way around.

Department of Mechatronics had organized a Value added Course on “Solid Works” by inviting Mr. K. SIVASUBRAMANIAM to equip our students with these kinds of additional skill sets from 5.8.2019 to 10.8.2019(6days). Students felt that the value added course was so interesting and useful.

VAC on "Programming of 8051 Microcontroller" - Report

1.7.2016 to 24.9.2016 (60hrs)

We have conducted the value added course on "Programming 8051 Microcontroller" from 1.7.2016 to 24.9.2016 for third year students of Mechatronics Engineering.

Mrs. P.Kavitha Associate Professor, Mechatronics Engineering - MAM School of Engineering gives the training for the students from 1.7.2016 to 24.9.2016 - (60 Hours). As per the direction by the principal sir, the necessary arrangement has made by Mr.M.Chandrasekar, Assistant Professor like invitation, inform the students regarding the schedule of the course and etc.

About Programming 8051 Microcontroller:

The microcontroller 8051 applications include a large number of machines, principally because it is simple to incorporate in a project or to assemble a machine around it. The following are the key spots of the spotlight:

Energy Management: Competent measuring device systems aid in calculating energy consumption in domestic and industrialized applications. These meter systems are prepared competent by integrating microcontrollers.

Touch screens: A high degree of microcontroller suppliers integrate touch sensing abilities in their designs. Transportable devices such as media players, gaming devices & cell phones are some illustrations of micro-controller integrated with touch sensing screens.

Automobiles: The microcontroller 8051 discovers broad recognition in supplying automobile solutions. They are extensively utilized in hybrid motor

vehicles to control engine variations. Also, works such as cruise power and anti-brake mechanism have created it more capable with the amalgamation of micro-controllers.

Medical Devices: Handy medicinal gadgets such as glucose & blood pressure monitors bring into play micro-controllers, to put on view the measurements, as a result, offering higher dependability in giving correct medical results.
